

Assignment

Create a front-end for a record keeping application that stores records of thousands of working professionals.

The layout of the application should be as follows:

1. Two page application. Create a login page with username and password. Route to the next page upon successful login. User data should be available in Context API.
2. Use any publicly available sample database/api to fetch the data of some users.
3. Create the layout as shown above.
4. Sort the users' data according to gender and employment type (you can use any other parameters available in your data for sorting) in the form of pi-charts as shown above.
5. Display the numbers used for pi-charts as shown.
6. Create a public git repository for the application and share the link.
7. Deploy the application to any free hosting application (e.g. Heroku, netlify) and share the link.
